INTRODUCTION

The Lepidoptera Tortricidae of Estonia and Lithuania have received only sporadic attention by both local and foreign lepidopterists, and/or often were treated together in the fauna of nearest countries. In the Lepidoptera of Europe Karsholt & Razowski (1996) list 336 Tortricidae for Estonia and 354 for Lithuania, while in the checklist of the electronic version of Fauna Europaea (Aarvik, 2004) the number of Tortricidae reported from Estonia is 363 and from Lithuania is 340.

Recently, in the catalogue of "Estonian Lepidoptera" Jürivete & Õunap (2008) registered 372 species of tortricids, whereas in the annotated catalogue of "Lepidoptera of Lithuania" Ivinskis (2004) recorded for this family 364 taxa.

In the present paper, the species listed are 125, 32 for Estonia and 110 for Lithuania, of which 9 are cited for the first time in Lithuanian fauna: *Aethes piercei* Obratzsov, 1952, *Aethes moribundana* (Staudinger, 1859), *Lozotaenia cupidinana* (Staudinger, 1859), *Phiaris stibiana* (Guenée, 1845), *Pseudophiaris sappadana* (Della Beffa & Rocca, 1937), *Eucosma scutana* (Constant, 1863), *Rhyacionia miniatana* (Staudinger, 1871), *Dichrorampha vancouverana* McDunnough, 1935, and *Dichrorampha obscuratana* (Wolff, 1955).

In the compilation of this list we follow the systematic arrangement adopted by Razowski (2002, 2003) and Trematerra (2003).
